03 RETROSPECTIVE EVALUATION

1,447 BOUTS

2023-12-09 to 2026-09-19

59.23%	0.66272	0.23537
WINNER ACCURACY	CALIBRATED LOG LOSS	BRIER SCORE

V3 log loss: 0.67123. Current model: 0.66272. Absolute difference: -0.00851. Lower loss is better.

95% paired event-date bootstrap interval / log-loss difference: [-0.01170, -0.00546].

This measures conditional resampling variation in the retained benchmark. It does not account for dataset, identity, model-selection, or source-timing uncertainty.

Rolling origin	5,278 bouts / 59.36% accuracy / 0.66079 loss
2026 / weaker current year	398 bouts / 56.78% accuracy / 0.67580 loss

The fixed benchmark was reported previously and is not a fresh holdout. The 2016-2026 rolling summary includes the 2016-2023 development years used to select settings. Bootstrap intervals exclude data and selection uncertainty.

READING THE MODEL

The model estimates the bout winner from earlier UFC results, Elo history, experience, recent form, rest, and available birth dates. An age-above-32 term allows an additional age-related effect. Missing optional inputs contribute neutrally. Coverage describes available evidence, not a fighter's ability. Model factors are associations in log-odds units, not causal explanations.

FORECAST LIMITS

- These are forecasts for an unstarted event using retrospectively assembled research history; they do not establish operating readiness or a wagering edge.
- 8 matchups are not scored because stable research identities are unresolved. Provisional identities were not silently merged.
- No reach or fight-statistics inputs are available. Injuries, training camps, matchup style, non-UFC records and later results are not modeled.
- Probabilities describe model estimates, not certainty. A 60% favorite can lose four times in ten even under perfect calibration. The latest yearly benchmark is weaker than the full-history result.
- The card can change before fight night. This frozen edition does not update automatically.
